DIANETICS

MAJOR AUDITING FAULTS

The major Dianetic auditing faults observed over a large number of recent case supervised sessions are:

1. **Not doing it.** Not doing it at all. Finding something but not running it out. Not continuing down the chain. Not continuing to audit what is now troubling the PC. Not finding a new chain or somatic to erase.

2. **Crossing Dianetics WITH Scientology**. These are two separate subjects. All the data of Dianetics that is used in practise is contained in the Dianetics course.

3. **Invalidating what the pc says it is.** Changing what the PC says on the Health Form. Refusing to take what the PC gives as the incident because the auditor considers it not to be a Lock, Secondary, or Engram.

4. **Not discharging each incident contacted on the chain.** Only doing one run through an incident then going earlier leaving restimulated incidents all over the track.

5. **Ceasing to run the chain after obtaining an F/N on a lock or secondary.** Failure to distinguish between key-out and erasure.

6. **Failing to use Dianetic assists on person who has had recent operation, accident, or severe loss.** Failing to erase the engram chain as soon as possible after the accident. Neglecting one's fellows and not using Dianetics to help them.

7. **Following narrative chain instead of somatic chain.**

8. **Attempting to run out a medical term.** Running migraine headache, sciatica, etc. instead of finding out what it feels like to the PC and using that for a chain.

9. **Assigning a pc with psychotic history to a non-standard auditor.** With such a PC you have to be very careful to go to F/N or erase and not let them be goofed up by an auditor who doesn't follow exact procedure and the Auditors Code.

10. **Failing to erase the cause of something.** When you fail to erase the cause of something you can expect it to come back. It may even come back at the end of the session.

11. **Assigning husband-wife type auditing teams.** This should be avoided when ever possible as it requires a very good auditor indeed to be effective when he or she is also the husband or wife.

12. **Running items taken randomly** instead of doing a meter assessment, taking largest read, checking for PC interest and then running.

13. **Taking up a new somatic when the pc mentions it** instead of continuing to erase the chain already started.

14. **Improper R3R procedure.** Particularly doing duration step on second and subsequent runs through the same incident. See HCOB 27 April 1969.

15. **Running an incident or somatic chain pc is not interested in.** Read was on protest, not on the somatic.

16. **Not asking the pc after second run through if it is getting more solid or erasing.**

17. **Out admin.** Mainly illegible reports and not stating what chain is being run or how.

18. **Invalidating pc ability to erase.** Done by trying to get an earlier incident when the current incident is erasing, or by continuing to grind on with something already erased.

19. **Grinding on an incident too late on the chain.**

20. **Auditor not understanding erasure.** Common one is auditor thinking a picture getting more visible is erasing.

21. **Auditing a pc who doesn't know what is happening.** PC doesn't understand what a session is or what Erasure, Locks, Secondaries, or Engrams are.

22. **Giving altered training or evaluative examination.** Messing up the material being taught or the standard so he fails to learn the exact simplicity of Dianetics in the first place.

The main fault of Dianetics has been **not doing it.** Standard Dianetics fully applied produced miraculous results.
